# Math 1600, Section 11, Fall 2016 - Statistics <br> HW 13 - Due December 9, 2016 

Name: $\qquad$
True or False:

1. Confidence intervals based on the $t$-distribution are wider than those based on the standard normal distribution.
T or F
2. A hypothesis test for a sample mean with small samples and sample size of $n$ has $n / 2$ degrees of freedom.
T or F
3. The $t$-distribution has less variability than the standard normal distribution.

T or F

## Short Answer:

4. The quantity $T=\frac{\bar{X}-\mu}{S / \sqrt{n}}$ has $\qquad$ degrees of freedom.
5. The $t$-distribution is symmetric about $\qquad$ .
6. The upper .01 point of the $t$-distribution with 14 d.f. is $\qquad$ .
7. The lower .05 point of the $t$-distribution with 7 d.f. is $\qquad$ .
8. The 97.5 th percentile of the $t$-distribution with 23 d.f. is $\qquad$ .
9. For the t -distribution with 11 d.f. the probability $\mathrm{T}>2.9$ is between $\qquad$ and
$\qquad$ -.

Computations:
10. Given the following, compute a $95 \%$ confidence interval for the population mean, $\mu$. $n=17, \sum x_{i}=220, \sum\left(x_{i}-\bar{x}\right)^{2}=75$
11. A manager wants to estimate the time it takes to process an order. A random sample of 6 recent orders yields the following times:
$\begin{array}{lllll}28 & 26 & 25 & 30 & 22\end{array} 34$
Determine a $90 \%$ confidence interval for the true time to fill orders. State any assumptions you make.

## True or False:

1. The $\chi^{2}$ distribution is an example of a symmetric distribution.

Tor F
2. Inferences on a population standard deviation are based on the $t$-distribution.

T or F
3. If a $95 \%$ confidence interval contains a particular value, $\mu_{0}$, then the two sided hypothesis test with a null hypothesis using $\mu_{0}$ with $\alpha=.05$ would lead to a rejection of the null hypothesis.
T or F

## Short Answer:

4. The upper $5 \%$ of the $\chi^{2}$ distribution with 8 degrees of freedom is $\qquad$ .
5. 30.19 is the upper $\qquad$ $\%$ of the $\chi^{2}$ with 17 degrees of freedom.
6. The lower $5 \%$ of the $\chi^{2}$ distribution with 22 degrees of freedom is $\qquad$ .
(For 7 and 8.) Suppose that from a random sample a $90 \%$ confidence interval for the population mean has been found to be $(12.8,14.3)$.
7. Would $H_{0}: \mu=15$ be rejected in favor of $H_{1}: \mu \neq 15$ at $\alpha=.10$ ?
a) yes
b) no
c) cannot tell
8. Would $H_{0}: \mu=13$ be rejected in favor of $H_{1}: \mu \neq 13$ at $\alpha=.10$ ?
a) yes
b) no
c) cannot tell

## Computations:

9. For data from a set of $n=10$ observations, one has calculated the $95 \%$ confidence interval for $\sigma$ and obtained the result $(4.05,10.75)$.
a. What was the standard deviation $s$ for the sample? (Hint: Examine how s enters the formula of a confidence interval.)
b. Calculate a $90 \%$ confidence interval for $\sigma$.
