## Matching

Def. Given an undirected graph $G=(V, E)$ a subset of edges $M \subseteq E$ is a matching if each node appears in at most one edge in $M$.

Max matching. Given a graph, find a max cardinality matching.

## Bipartite matching

Def. A graph $G$ is bipartite if the nodes can be partitioned into two subsets $L$ and $R$ such that every edge connects a node in $L$ to one in $R$.

Bipartite matching. Given a bipartite graph $G=(L \cup R, E)$, find a max cardinality matching.

## Bipartite matching

Def. A graph $G$ is bipartite if the nodes can be partitioned into two subsets $L$ and $R$ such that every edge connects a node in $L$ to one in $R$.

Bipartite matching. Given a bipartite graph $G=(L \cup R, E)$, find a max cardinality matching.

R
matching: 1-1', 2-2', 3-4', 4-5'

## Bipartite matching: max flow formulation

- Create digraph $G^{\prime}=\left(L \cup R \cup\{s, t\}, E^{\prime}\right)$.
- Direct all edges from $L$ to $R$, and assign infinite (or unit) capacity.
- Add source $s$, and unit capacity edges from $s$ to each node in $L$.
- Add $\operatorname{sink} t$, and unit capacity edges from each node in $R$ to $t$.

Max flow formulation: proof of correctness
Theorem. Max cardinality of a matching in $G=$ value of max flow in $G^{\prime}$.
Pf. $\leq$

- Given a max matching $M$ of cardinality $k$.
- Consider flow $f$ that sends 1 unit along each of $k$ paths.
- $f$ is a flow, and has value $k$.

## Max flow formulation: proof of correctness

Theorem. Max cardinality of a matching in $G=$ value of max flow in $G^{\prime}$. Pf. $\geq$

- Let $f$ be a max flow in $G^{\prime}$ of value $k$.
- Integrality theorem $\Rightarrow k$ is integral and can assume $f$ is $0-1$.
- Consider $M=$ set of edges from $L$ to $R$ with $f(e)=1$.
- each node in $L$ and $R$ participates in at most one edge in $M$
- $|M|=k:$ consider cut $(L \cup s, R \cup t) \quad$ -

## Perfect matching in a bipartite graph

Def. Given a graph $G=(V, E)$ a subset of edges $M \subseteq E$ is a perfect matching if each node appears in exactly one edge in $M$.
Q. When does a bipartite graph have a perfect matching?

Structure of bipartite graphs with perfect matchings.

- Clearly we must have $|L|=|R|$.
- What other conditions are necessary?
- What conditions are sufficient?

## Perfect matching in a bipartite graph

Notation. Let $S$ be a subset of nodes, and let $N(S)$ be the set of nodes adjacent to nodes in $S$.

Observation. If a bipartite graph $G=(L \cup R, E)$ has a perfect matching, then $|N(S)| \geq|S|$ for all subsets $S \subseteq L$.
Pf. Each node in $S$ has to be matched to a different node in $N(S)$.

$$
\begin{gathered}
S=\{2,4,5\} \\
N(S)=\left\{2^{\prime}, 5^{\prime}\right\}
\end{gathered}
$$

## Hall's theorem

Theorem. Let $G=(L \cup R, E)$ be a bipartite graph with $|L|=|R|$. $G$ has a perfect matching iff $|N(S)| \geq|S|$ for all subsets $S \subseteq L$.

Pf. $\Rightarrow$ This was the previous observation.

## Proof of Hall's theorem

Pf. $\Leftarrow$ Suppose $G$ does not have a perfect matching.

- Formulate as a max flow problem and let $(A, B)$ be min cut in $G^{\prime}$.
- By max-flow min-cut theorem, $\operatorname{cap}(A, B)<|L|$.
- Define $L_{A}=L \cap A, L_{B}=L \cap B, R_{A}=R \cap A$.
- $\operatorname{cap}(A, B)=\left|L_{B}\right|+\left|R_{A}\right|$.
- Since min cut can't use $\infty$ edges: $N\left(L_{A}\right) \subseteq R_{A}$.
- $\left|N\left(L_{A}\right)\right| \leq\left|R_{A}\right|=\operatorname{cap}(A, B)-\left|L_{B}\right|<|L|-\left|L_{B}\right|=\left|L_{A}\right|$.
- Choose $S=L_{A}$. -

## Bipartite matching running time

Theorem. The Ford-Fulkerson algorithm solves the bipartite matching problem in $O(m n)$ time.

Theorem. [Hopcroft-Karp 1973] The bipartite matching problem can be solved in $O\left(m n^{1 / 2}\right)$ time.

SIAM J. Comput.
Vol. 2, No. 4, December 1973

## AN $\boldsymbol{n}^{\mathbf{5 / 2}}$ ALGORITHM FOR MAXIMUM MATCHINGS IN BIPARTITE GRAPHS* JOHN E. HOPCROFT $\dagger$ and RICHARD M. KARP $\ddagger$

[^1]
## Nonbipartite matching

Nonbipartite matching. Given an undirected graph (not necessarily bipartite), find a matching of maximum cardinality.

- Structure of nonbipartite graphs is more complicated.
- But well-understood.
- Blossom algorithm: $O\left(n^{4}\right)$.
[Tutte-Berge, Edmonds-Galai]
- Best known: $O\left(m n^{1 / 2}\right)$.
[Edmonds 1965]
[Micali-Vazirani 1980, Vazirani 1994]

PATHS, TREES, AND FLOWERS
JACK EDMONDS

1. Introduction. A graph $G$ for purposes here is a finite set of elements called vertices and a finite set of elements called edges such that each edge meets exactly two vertices, called the end-points of the edge. An edge is said to join its end-points.
A matching in $G$ is a subset of its edges such that no two meet the same vertex. We describe an efficient algorithm for finding in a given graph a matching of maximum cardinality. This problem was posed and partly solved by C. Berge; see Sections 3.7 and 3.8.

Combinatorica 14 (1) (1994) 71-109

A THEORY OF ALTERNATING PATHS AND BLOSSOMS FOR PROVING CORRECTNESS OF THE $O(\sqrt{V} E)$ GENERAL GRAPH MAXIMUM MATCHING ALGORITHM

VIJAY V. VAZIRANI ${ }^{1}$
Received December 30, 1989
Revised June 15, 1993

## Historical significance (Jack Edmonds 1965)

2. Digression. An explanation is due on the use of the words "efficient algorithm." First, what I present is a conceptual description of an algorithm and not a particular formalized algorithm or "code."

For practical purposes computational details are vital. However, my purpose is only to show as attractively as I can that there is an efficient algorithm. According to the dictionary, "efficient" means "adequate in operation or performance." This is roughly the meaning I want-in the sense that it is conceivable for maximum matching to have no efficient algorithm. Perhaps a better word is "good."

I am claiming, as a mathematical result, the existence of a good algorithm for finding a maximum cardinality matching in a graph.

There is an obvious finite algorithm, but that algorithm increases in difficulty exponentially with the size of the graph. It is by no means obvious whether or not there exists an algorithm whose difficulty increases only algebraically with the size of the graph.

## k-regular bipartite graphs

## Dancing problem.

- Exclusive Ivy league party attended by $n$ men and $n$ women.
- Each man knows exactly $k$ women; each woman knows exactly $k$ men.
- Acquaintances are mutual.
- Is it possible to arrange a dance so that each woman dances with a different man that she knows?

Mathematical reformulation. Does every $k$-regular bipartite graph have a perfect matching?

Ex. Boolean hypercube.

2-regular bipartite graph

## k-regular bipartite graphs have perfect matchings

Theorem. Every $k$-regular bipartite graph $G$ has a perfect matching. Pf.

- Size of max matching = value of max flow in $G^{\prime}$.
- Consider flow

$$
f(u, v)= \begin{cases}1 / k & \text { if }(\mathrm{u}, \mathrm{v}) \in E \\ 1 & \text { if } \mathrm{u}=s \text { or } \mathrm{v}=t \\ 0 & \text { otherwise }\end{cases}
$$

- $f$ is a flow in $G^{\prime}$ and its value $=n \Rightarrow$ perfect matching. -

a feasible flow $f$ of value $n$

## Edge-disjoint paths

Def. Two paths are edge-disjoint if they have no edge in common.

Disjoint path problem. Given a digraph $G=(V, E)$ and two nodes $s$ and $t$, find the max number of edge-disjoint $s \rightarrow t$ paths.

## Edge-disjoint paths

Def. Two paths are edge-disjoint if they have no edge in common.

Disjoint path problem. Given a digraph $G=(V, E)$ and two nodes $s$ and $t$, find the max number of edge-disjoint $s \rightarrow t$ paths.

Ex. Communication networks.

## Edge-disjoint paths

Max flow formulation. Assign unit capacity to every edge.

Theorem. Max number edge-disjoint $s \rightarrow t$ paths equals value of max flow. Pf. $\leq$

- Suppose there are $k$ edge-disjoint $s \rightarrow t$ paths $P_{1}, \ldots, P_{k}$.
- Set $f(e)=1$ if $e$ participates in some path $P_{j}$; else set $f(e)=0$.
- Since paths are edge-disjoint, $f$ is a flow of value $k$. -

## Edge-disjoint paths

Max flow formulation. Assign unit capacity to every edge.

Theorem. Max number edge-disjoint $s \rightarrow t$ paths equals value of max flow.
Pf. $\geq$

- Suppose max flow value is $k$.
- Integrality theorem $\Rightarrow$ there exists 0-1 flow $f$ of value $k$.
- Consider edge $(s, u)$ with $f(s, u)=1$.
- by conservation, there exists an edge $(u, v)$ with $f(u, v)=1$
- continue until reach $t$, always choosing a new edge
- Produces $k$ (not necessarily simple) edge-disjoint paths.

## Network connectivity

Def. A set of edges $F \subseteq E$ disconnects $t$ from $s$ if every $s \rightarrow t$ path uses at least one edge in $F$.

Network connectivity. Given a digraph $G=(V, E)$ and two nodes $s$ and $t$, find min number of edges whose removal disconnects $t$ from $s$.

## Menger's theorem

Theorem. [Menger 1927] The max number of edge-disjoint $s \rightarrow t$ paths is equal to the min number of edges whose removal disconnects $t$ from $s$.

Pf. $\leq$

- Suppose the removal of $F \subseteq E$ disconnects $t$ from $s$, and $|F|=k$.
- Every $s \rightarrow t$ path uses at least one edge in $F$.
- Hence, the number of edge-disjoint paths is $\leq k$. -

## Menger's theorem

Theorem. [Menger 1927] The max number of edge-disjoint $s \rightarrow t$ paths equals the min number of edges whose removal disconnects $t$ from $s$.

Pf. $\geq$

- Suppose max number of edge-disjoint paths is $k$.
- Then value of max flow $=k$.
- Max-flow min-cut theorem $\Rightarrow$ there exists a cut $(A, B)$ of capacity $k$.
- Let $F$ be set of edges going from $A$ to $B$.
- $|F|=k$ and disconnects $t$ from $s$. .

## Edge-disjoint paths in undirected graphs

Def. Two paths are edge-disjoint if they have no edge in common.

Disjoint path problem in undirected graphs. Given a graph $G=(V, E)$ and two nodes $s$ and $t$, find the max number of edge-disjoint $s-t$ paths.

## Edge-disjoint paths in undirected graphs

Def. Two paths are edge-disjoint if they have no edge in common.

Disjoint path problem in undirected graphs. Given a graph $G=(V, E)$ and two nodes $s$ and $t$, find the max number of edge-disjoint $s-t$ paths.

## Edge-disjoint paths in undirected graphs

Def. Two paths are edge-disjoint if they have no edge in common.

Disjoint path problem in undirected graphs. Given a graph $G=(V, E)$ and two nodes $s$ and $t$, find the max number of edge-disjoint $s-t$ paths.

## Edge-disjoint paths in undirected graphs

Max flow formulation. Replace edge edge with two antiparallel edges and assign unit capacity to every edge.

Observation. Two paths $P_{1}$ and $P_{2}$ may be edge-disjoint in the digraph but not edge-disjoint in the undirected graph.

```
    if }\mp@subsup{P}{1}{}\mathrm{ uses edge (u, v)
and }\mp@subsup{P}{2}{}\mathrm{ uses its antiparallel edge (v, u)
```

## Edge-disjoint paths in undirected graphs

Max flow formulation. Replace edge edge with two antiparallel edges and assign unit capacity to every edge.

Lemma. In any flow network, there exists a maximum flow $f$ in which for each pair of antiparallel edges $e$ and $e^{\prime}$, either $f(e)=0$ or $f\left(e^{\prime}\right)=0$ or both. Moreover, integrality theorem still holds.

## Pf. [ by induction on number of such pairs of antiparallel edges ]

- Suppose $f(e)>0$ and $f\left(e^{\prime}\right)>0$ for a pair of antiparallel edges $e$ and $e^{\prime}$.
- Set $f(e)=f(e)-\delta$ and $f\left(e^{\prime}\right)=f\left(e^{\prime}\right)-\delta$, where $\delta=\min \left\{f(e), f\left(e^{\prime}\right)\right\}$.
- $f$ is still a flow of the same value but has one fewer such pair. -

## Edge-disjoint paths in undirected graphs

Max flow formulation. Replace edge edge with two antiparallel edges and assign unit capacity to every edge.

Lemma. In any flow network, there exists a maximum flow $f$ in which for each pair of antiparallel edges $e$ and $e^{\prime}$, either $f(e)=0$ or $f\left(e^{\prime}\right)=0$ or both. Moreover, integrality theorem still holds.

Theorem. Max number edge-disjoint $s \rightarrow t$ paths equals value of max flow. Pf. Similar to proof in digraphs; use lemma.

## Menger's theorems

Theorem. Given an undirected graph with two nodes $s$ and $t$, the max number of edge-disjoint $s-t$ paths equals the min number of edges whose removal disconnects $s$ and $t$.

Theorem. Given a undirected graph with two nonadjacent nodes $s$ and $t$, the max number of internally node-disjoint $s-t$ paths equals the min number of internal nodes whose removal disconnects $s$ and $t$.

Theorem. Given an directed graph with two nonadjacent nodes $s$ and $t$, the max number of internally node-disjoint $s \rightarrow t$ paths equals the min number of internal nodes whose removal disconnects $t$ from $s$.

## Circulation with demands

Def. Given a digraph $G=(V, E)$ with nonnegative edge capacities $c(e)$ and node supply and demands $d(v)$, a circulation is a function that satisfies:

- For each $e \in E: \quad 0 \leq f(e) \leq c(e)$
- For each $v \in V: \sum_{e \text { in to } v} f(e)-\sum_{e \text { out of } v} f(e)=d(v)$ (conservation)
(supply node)

## Circulation with demands: max-flow formulation

- Add new source $s$ and $\operatorname{sink} t$.
- For each $v$ with $d(v)<0$, add edge $(s, v)$ with capacity $-d(v)$.
- For each $v$ with $d(v)>0$, add edge $(v, t)$ with capacity $d(v)$.

Claim. $G$ has circulation iff $G^{\prime}$ has max flow of value $D=\sum_{v: d(v)>0} d(v)=\sum_{v: d(v)<0}-d(v)$

## Circulation with demands

Integrality theorem. If all capacities and demands are integers, and there exists a circulation, then there exists one that is integer-valued.

Pf. Follows from max-flow formulation + integrality theorem for max flow.

Theorem. Given ( $V, E, c, d$ ), there does not exist a circulation iff there exists a node partition $(A, B)$ such that $\Sigma_{v \in B} d(v)>\operatorname{cap}(A, B)$.

Pf sketch. Look at min cut in $G^{\prime}$.
demand by nodes in B exceeds
supply of nodes in B plus
max capacity of edges going from $A$ to $B$

## Circulation with demands and lower bounds

Feasible circulation.

- Directed graph $G=(V, E)$.
- Edge capacities $c(e)$ and lower bounds $\ell(e)$ for each edge $e \in E$.
- Node supply and demands $d(v)$ for each node $v \in V$.

Def. A circulation is a function that satisfies:

- For each $e \in E: \quad \ell(e) \leq f(e) \leq c(e) \quad$ (capacity)
- For each $v \in V: \sum_{e \text { in to } v} f(e)-\sum_{e \text { out of } v} f(e)=d(v)$ (conservation)

Circulation problem with lower bounds. Given ( $V, E, \ell, c, d$ ), does there exist a feasible circulation?

## Circulation with demands and lower bounds

Max flow formulation. Model lower bounds as circulation with demands.

- Send $\ell(e)$ units of flow along edge $e$.
- Update demands of both endpoints.

Theorem. There exists a circulation in $G$ iff there exists a circulation in $G^{\prime}$.
Moreover, if all demands, capacities, and lower bounds in $G$ are integers, then there is a circulation in $G$ that is integer-valued.

Pf sketch. $f(e)$ is a circulation in $G$ iff $f^{\prime}(e)=f(e)-\ell(e)$ is a circulation in $G^{\prime}$.

## Survey design

- Design survey asking $n_{1}$ consumers about $n_{2}$ products.
- Can only survey consumer $i$ about product $j$ if they own it.
- Ask consumer $i$ between $c_{i}$ and $c_{i}{ }^{\prime}$ questions.
- Ask between $p_{j}$ and $p_{j}{ }^{\prime}$ consumers about product $j$.

Goal. Design a survey that meets these specs, if possible.

Bipartite perfect matching. Special case when $c_{i}=c_{i}{ }^{\prime}=p_{j}=p_{j}^{\prime}=1$.

## Survey design

Max-flow formulation. Model as circulation problem with lower bounds.

- Add edge $(i, j)$ if consumer $j$ owns product $i$.
- Add edge from $s$ to consumer $j$.
- Add edge from product $i$ to $t$.
- Add edge from $t$ to $s$.
- Integer circulation $\Leftrightarrow$ feasible survey design.

## Airline scheduling

## Airline scheduling.

- Complex computational problem faced by nation's airline carriers.
- Produces schedules that are efficient in terms of:
- equipment usage, crew allocation, customer satisfaction
- in presence of unpredictable issues like weather, breakdowns
- One of largest consumers of high-powered algorithmic techniques.
"Toy problem."
- Manage flight crews by reusing them over multiple flights.
- Input: set of $k$ flights for a given day.
- Flight $i$ leaves origin $o_{i}$ at time $s_{i}$ and arrives at destination $d_{i}$ destination at time $f_{i}$.
- Minimize number of flight crews.

## Airline scheduling

Circulation formulation. [to see if $c$ crews suffice]

- For each flight $i$, include two nodes $u_{i}$ and $v_{i}$.
- Add source $s$ with demand $-c$, and edges $\left(s, u_{i}\right)$ with capacity 1.
- Add $\operatorname{sink} t$ with demand $c$, and edges $\left(v_{i}, t\right)$ with capacity 1.
- For each $i$, add edge ( $u_{i}, v_{i}$ ) with lower bound and capacity 1.
- if flight $j$ reachable from $i$, add edge $\left(v_{i}, u_{j}\right)$ with capacity 1 .

## Airline scheduling: running time

Theorem. The airline scheduling problem can be solved in $O\left(k^{3} \log k\right)$ time. Pf.

- $k=$ number of flights.
- $c=$ number of crews (unknown).
- $O(k)$ nodes, $O\left(k^{2}\right)$ edges.
- At most $k$ crews needed.
$\Rightarrow$ solve $\lg k$ circulation problems. $\longleftarrow$ binary search for optimal value $c^{*}$
- Value of the flow is between 0 and $k$.
$\Rightarrow$ at most $k$ augmentations per circulation problem.
- Overall time $=O\left(k^{3} \log k\right)$.

Remark. Can solve in $O\left(k^{3}\right)$ time by formulating as minimum flow problem.

## Airline scheduling: postmortem

Remark. We solved a toy problem.

Real-world problem models countless other factors:

- Union regulations: e.g., flight crews can only fly certain number of hours in given interval.
- Need optimal schedule over planning horizon, not just one day.
- Deadheading has a cost.
- Flights don't always leave or arrive on schedule.
- Simultaneously optimize both flight schedule and fare structure.

## Message.

- Our solution is a generally useful technique for efficient reuse of limited resources but trivializes real airline scheduling problem.
- Flow techniques useful for solving airline scheduling problems (and are widely used in practice).
- Running an airline efficiently is a very difficult problem.

## Image segmentation

Image segmentation.

- Central problem in image processing.
- Divide image into coherent regions.

Ex. Three people standing in front of complex background scene. Identify each person as a coherent object.

liver and hepatic vascularization segmentation

## Image segmentation

## Foreground / background segmentation.

- Label each pixel in picture as belonging to foreground or background.
- $V=$ set of pixels, $E=$ pairs of neighboring pixels.
- $a_{i} \geq 0$ is likelihood pixel $i$ in foreground.
- $b_{i} \geq 0$ is likelihood pixel $i$ in background.
- $p_{i j} \geq 0$ is separation penalty for labeling one of $i$ and $j$ as foreground, and the other as background.

Goals.

- Accuracy: if $a_{i}>b_{i}$ in isolation, prefer to label $i$ in foreground.
- Smoothness: if many neighbors of $i$ are labeled foreground, we should be inclined to label $i$ as foreground.
- Find partition $(A, B)$ that maximizes:

$$
\sum_{i \in A} a_{i}+\sum_{j \in B} b_{j}-\sum_{\substack{(i, j) \in E \\|A \cap\{i, j\}|=1}} p_{i j}
$$

## Image segmentation

Formulate as min cut problem.

- Maximization.
- No source or sink.
- Undirected graph.

Turn into minimization problem.

- Maximizing

$$
\sum_{i \in A} a_{i}+\sum_{j \in B} b_{j}-\sum_{\substack{(i, j) \in E \\|A \cap\{i, j\}|=1}} p_{i j}
$$

- is equivalent to minimizing $\underbrace{\left(\sum_{i \in V} a_{i}+\sum_{j \in V} b_{j}\right)}_{\text {a constant }}-\sum_{i \in A} a_{i}-\sum_{j \in B} b_{j}+\sum_{\substack{(i, j) \in E \\|A \cap\{i, j\}|=1}} p_{i j}$
- or alternatively

$$
\sum_{j \in B} a_{j}+\sum_{i \in A} b_{i}+\sum_{\substack{(i, j) \in E \\|A \cap\{i, j\}|=1}} p_{i j}
$$

## Image segmentation

Formulate as min cut problem $G^{\prime}=\left(V^{\prime}, E^{\prime}\right)$.

- Include node for each pixel.
- Use two antiparallel edges instead of undirected edge.
- Add source $s$ to correspond to foreground.
- Add $\operatorname{sink} t$ to correspond to background.
edge in G

two antiparallel edges in $\mathbf{G}^{\prime}$

## Image segmentation

Consider min cut $(A, B)$ in $G^{\prime}$.

- $A=$ foreground.

$$
\operatorname{cap}(A, B)=\sum_{j \in B} a_{j}+\sum_{i \in A} b_{i}+\sum_{\substack{(i, j) \in E \\ i \in A, j \in B}} p_{i j} \longleftarrow \substack{\text { if } i \text { and } j \text { on different sides, } \\ \text { pij }_{i j} \text { counted exactly once }}
$$

- Precisely the quantity we want to minimize.

## 7. Network Flow II

, bipartite matching

- disjoint paths
- extensions to mex flow
- survey design
- airline scheduling
- image segmentation
- project selection
- baseball elimination

## Project selection (maximum weight closure problem)

Projects with prerequisites.

- Set of possible projects $P$ : project $v$ has associated revenue $p_{v}$.
- Set of prerequisites $E$ : if $(v, w) \in E$, cannot do project $v$ unless also do project $w$.
- A subset of projects $A \subseteq P$ is feasible if the prerequisite of every project in $A$ also belongs to $A$.

Project selection problem. Given a set of projects $P$ and prerequisites $E$, choose a feasible subset of projects to maximize revenue.

## Project selection: prerequisite graph

Prerequisite graph. Add edge $(v, w)$ if can't do $v$ without also doing $w$.

$\{v, w, x\}$ is feasible

$\{v, x\}$ is infeasible

## Project selection: min-cut formulation

Min-cut formulation.

- Assign capacity $\infty$ to all prerequisite edge.
- Add edge $(s, v)$ with capacity $p_{v}$ if $p_{v}>0$.
- Add edge $(v, t)$ with capacity $-p_{v}$ if $p_{v}<0$.
- For notational convenience, define $p_{s}=p_{t}=0$.

## Project selection: min-cut formulation

Claim. $(A, B)$ is min cut iff $A-\{s\}$ is optimal set of projects.

- Infinite capacity edges ensure $A-\{s\}$ is feasible.
- Max revenue because: $\operatorname{cap}(A, B)=\sum_{v \in B: p_{v}>0} p_{v}+\sum_{v \in A: p_{v}<0}\left(-p_{v}\right)$

$$
=\underbrace{\sum_{v: p_{v}>0} p_{v}}_{\text {constant }}-\sum_{v \in A} p_{v}
$$

## Open-pit mining

Open-pit mining. (studied since early 1960s)

- Blocks of earth are extracted from surface to retrieve ore.
- Each block $v$ has net value $p_{v}=$ value of ore - processing cost.
- Can't remove block $v$ before $w$ or $x$.

## Baseball elimination problem

Q. Which teams have a chance of finishing the season with the most wins?

| i | team |  | wins | losses | to play | ATL | PHI | NYM | MON |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | Atlanta | 83 | 71 | 8 | - | 1 | 6 | 1 |
| 1 |  | Philly | 80 | 79 | 3 | 1 | - | 0 | 2 |
| 2 |  | New York | 78 | 78 | 6 | 6 | 0 | - | 0 |
| 3 |  | Montreal | 77 | 82 | 3 | 1 | 2 | 0 | - |

Montreal is mathematically eliminated.

- Montreal finishes with $\leq 80$ wins.
- Atlanta already has 83 wins.

Remark. This is the only reason sports writers appear to be aware of conditions are sufficient but not necessary!

## Baseball elimination problem

Q. Which teams have a chance of finishing the season with the most wins?

| i | team |  | wins | losses | to play | ATL | PHI | NYM | MON |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | Atlanta | 83 | 71 | 8 | - | 1 | 6 | 1 |
| 1 |  | Philly | 80 | 79 | 3 | 1 | - | 0 | 2 |
| 2 |  | New York | 78 | 78 | 6 | 6 | 0 | - | 0 |
| 3 |  | Montreal | 77 | 82 | 3 | 1 | 2 | 0 | - |

Philadelphia is mathematically eliminated.

- Philadelphia finishes with $\leq 83$ wins.
- Either New York or Atlanta will finish with $\geq 84$ wins.

Observation. Answer depends not only on how many games already won and left to play, but on whom they're against.

## Baseball elimination problem

Current standings.

- Set of teams $S$.
- Distinguished team $z \in S$.
- Team $x$ has won $w_{x}$ games already.
- Teams $x$ and $y$ play each other $r_{x y}$ additional times.

Baseball elimination problem. Given the current standings, is there any outcome of the remaining games in which team $z$ finishes with the most (or tied for the most) wins?

[^2]
## Baseball elimination problem: max-flow formulation

Can team 4 finish with most wins?

- Assume team 4 wins all remaining games $\Rightarrow w_{4}+r_{4}$ wins.
- Divvy remaining games so that all teams have $\leq w_{4}+r_{4}$ wins.

## Baseball elimination problem: max-flow formulation

Theorem. Team 4 not eliminated iff max flow saturates all edges leaving $s$. Pf.

- Integrality theorem $\Rightarrow$ each remaining game between $x$ and $y$ added to number of wins for team $x$ or team $y$.
- Capacity on $(x, t)$ edges ensure no team wins too many games. -

## Baseball elimination: explanation for sports writers

Q. Which teams have a chance of finishing the season with the most wins?

| i | team |  | wins | losses | to play | NYY | BAL | BOS | TOR | DET |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | New York | 75 | 59 | 28 | - | 3 | 8 | 7 | 3 |
| 1 | - | Baltimore | 71 | 63 | 28 | 3 | - | 2 | 7 | 4 |
| 2 |  | Boston | 69 | 66 | 27 | 8 | 2 | - | 0 | 0 |
| 3 |  | Toronto | 63 | 72 | 27 | 7 | 7 | 0 | - | 0 |
| 4 |  | Detroit | 49 | 86 | 27 | 3 | 4 | 0 | 0 | - |

AL East (August 30, 1996)

Detroit is mathematically eliminated.

- Detroit finishes with $\leq 76$ wins.
- Wins for $R=\{$ NYY, BAL, BOS, TOR $\}=278$.
- Remaining games among \{ NYY, BAL, BOS, TOR $\}=3+8+7+2+7=27$.
- Average team in $R$ wins $305 / 4=76.25$ games.

## Baseball elimination: explanation for sports writers

Certificate of elimination.

$$
T \subseteq S, w(T):=\sum_{i \in T}^{\# \text { wins }} w_{i}, g(T):=\overbrace{\sum_{\{x, y\} \subseteq T}}^{\sum_{i} g_{x y}},
$$

Theorem. [Hoffman-Rivlin 1967] Team $z$ is eliminated iff there exists a subset $T^{*}$ such that

$$
w_{z}+g_{z}<\frac{w\left(T^{*}\right)+g\left(T^{*}\right)}{\left|T^{*}\right|}
$$

Pf. $\Leftarrow$

- Suppose there exists $T^{*} \subseteq S$ such that $w_{z}+g_{z}<\frac{w\left(T^{*}\right)+g\left(T^{*}\right)}{\left|T^{*}\right|}$.
- Then, the teams in $T^{*}$ win at least $\left(w\left(T^{*}\right)+g\left(T^{*}\right)\right) / I T^{*} \mid$ games on average.
- This exceeds the maximum number that team $z$ can win. -

## Baseball elimination: explanation for sports writers

Pf. $\Rightarrow$

- Use max-flow formulation, and consider min cut $(A, B)$.
- Let $T^{*}=$ team nodes on source side $A$ of min cut.
- Observe that game node $x-y \in A$ iff both $x \in T^{*}$ and $y \in T^{*}$.
- infinite capacity edges ensure if $x-y \in A$, then both $x \in A$ and $y \in A$
- if $x \in A$ and $y \in A$ but $x-y \notin A$, then adding $x-y$ to $A$ decreases the capacity of the cut by $g_{x y}$

## Baseball elimination: explanation for sports writers

Pf. $\Rightarrow$

- Use max-flow formulation, and consider min cut $(A, B)$.
- Let $T^{*}=$ team nodes on source side $A$ of min cut.
- Observe that game node $x-y \in A$ iff both $x \in T^{*}$ and $y \in T^{*}$.
- Since team $z$ is eliminated, by max-flow min-cut theorem,

$$
\begin{aligned}
g(S-\{z\}) & >\overbrace{g(S-\{z\})-g\left(T^{*}\right)}^{\operatorname{cap}(A, B)}+\overbrace{\sum_{x \in T^{*}}\left(w_{z}+g_{z}-w_{x}\right)}^{\text {capacity of game edges leaving s }} \text { sapacity of team edges entering t } \\
& =\overbrace{s\left(T^{*}\right)+\left|T^{*}\right|\left(w_{z}+g_{z}\right)}
\end{aligned}
$$

- Rearranging terms: $w_{z}+g_{z}<\frac{w\left(T^{*}\right)+g\left(T^{*}\right)}{\left|T^{*}\right|}$ •

    POSSIBLE WINNERS IN PARTIALLY COMPLETED TOURNAMENTS*
    BENJAMIN L. SCHWARTZ $\dagger$

    1. Introduction. In this paper, we shall investigate certain questions in tournament scheduling. For definiteness, we shall use the terminology of baseball. We shall be concerned with the categorization of teams into three classes during the closing days of the season. A team may be definitely eliminated from pennant possibility; it may be in contention, or it may have clinched the championship. It will be our convention that a team that can possibly tie for the pennant is considered still in contention. In this paper necessary and sufficient conditions are developed to classify any team properly into the appropriate category.
