Proofs using the Principle of Mathematical Induction

```
Principle of Mathematical Induction (Epp, p. 246)
```

Let P(n) be a property that is defined for integers n, and let a be a fixed integer. Suppose the following two statements are true:

1. P(a) is true. 2. For all integers $k \ge a$, if P(k) is true then P(k + 1) is true. Then the statement for all integers $n \ge a$, P(n) is true.

Dr. Martin's 5 step method to prove P(n) for all integers $n \ge n_0$.

1. Base Case: $P(n_0)$

If it is an equation be sure to check both sides separately.

2. Write down the Induction Hypothesis: n=k

Where k is a particular, but arbitrary integer greater than or equal to n_0

Let $k \in \mathbb{Z} \ni k \ge n_0$ and suppose P(k)

3. Write down what needs to be proved: n = k + 1

We must show that P(k+1)

4. Show P(k) implies P(k+1) by clear and convincing argument, usually starts:

```
Consider P(k+1)
```

5. Conclusion

By PMI P(n) $\forall n \in \mathbb{Z} \ni n \ge n_0$
